

WhispList App Summary

What it is

WhispList is a mobile app (Expo/React Native) for privately sharing wishes (hopes, fears, and confessions) with an empathy-first, optional-identity experience.

Who it's for

People who want a private, low-judgment space to share wishes and feel supported.

What it does

- Create and share wishes (hopes, fears, confessions) with optional identity.
- Public wishes are read-only and can be removed if reported or hidden by the author.
- Poll Mode adds two text choices (A/B) to a wish.
- Likes, comments, and replies trigger Expo push notifications.
- One-tap gifting via Venmo deep links with a Stripe fallback; gift totals update on confirmation.
- Split-pay (group gifting) uses Stripe-backed pledges and scheduled settlement.

How it works

- Client: Expo app with file-based routing in app/.
- Firebase client SDKs provide Auth, Firestore, Storage, Functions, and Analytics configured via .env (env.ts, firebase.ts).
- Cloud Functions expose gift endpoints (/gifts/start, /gifts/confirm) and update Firestore gift totals.
- A Firestore-triggered function sends Expo push notifications for new likes, comments, or replies (tokens stored in user profiles).

How to run

- Install dependencies: npm install.
- Create .env from .env.example and set the required EXPO_PUBLIC_FIREBASE_* values.
- Start the app: npx expo start.
